1 Look and match.

- 1 global warming
- 2 coastal
- 3 glacier
- 4 melting
- 5 habitat

2 Read and answer the questions.

ALASKA IS IN THE U.S.A., NEAR THE ARCTIC.
IT HAS A COLD, DRY, POLAR CLIMATE.
BUT IT IS CHANGING
BECAUSE OF GLOBAL WARMING.

In the past, the weather was very cold, and the ground was completely covered in **snow** in the north. There was also a lot of coastal sea **ice** and large glaciers.

But now, the weather is warmer. The temperatures are going to be rising, and, as a result, the sea ice is going to be melting. It's also not very **snowy** anymore in Alaska.

The snow and ice are melting, so polar bears are losing their habitat.

The temperatures today are around -20°C in January and 10°C in July. The weather is still cold in the winter, but warmer than in the past compared to the last 50 years.

Experts say that Alaska is going to get two degrees hotter by the year 2050.

In the past, the weather was cool in the forests in the south, but now there are more hot, **sunny** days. This can cause forest fires which destroy habitats and harm animals.

- 1 Where is Alaska? It is near the Arctic.
- 2 What was the weather in the north like before? It was very cold and snowy.
- 3 What is the weather in the north like now? It is warmer and less snowy.
- 4 Are the temperatures going to rise in the future? Yes, it is going to rise.
- 5 What was the weather in the forests like before? It was cool in the forests.
- 6 What is the weather in the forests like now? It is hot and sunny now.

3 Look and describe the pictures. Say how the climates are different.

In picture D, the leaves are brown. And it's cloudy.
